

PROJECT Implementation REPORT

CRICKET LEAGUE MANAGEMENT SYSTEM

Abstract:

The project focusses on developing a database for cricket league which is one of the biggest tournament in the world. There exists a system which stores details about the matches but fails to take minute details about players and their skills. The main purpose of this database management system is to hold information about everyone involved with the cricket. This database will help team owners to keep a record of matches, teams and players shinning in the tournament. This database plans eliminate administrative work and provide records and statistics of players.

IPL (CRICKET LEAGUE) MANAGEMENT SYSTEM-Project

Summary:

The project focusses on developing a database for IPL cricket league which is one of the biggest tournament in the world. There exists a system which stores details about the matches but fails to take minute details about players and their skills. The main purpose of this database management system is to hold information about everyone involved with the IPL. This database will help team owners to keep a record of matches, teams and players shinning in the tournament. This database plans eliminate administrative work and provide records and statistics of players.

There are 10 teams participating in IPL tournament and each team has more than 30 players, so it's difficult to keep track of each player. Each player has runs, wickets, matches played which makes it more complex to keep a note on each player. So without a database it will be very difficult to keep track of all of this data. A database will make it easier for the leagues to manage its information about its team, matches played between teams and players in their respective teams. Currently, there are organization who has details about players, but they haven't computed the statistics. This database plan to optimize storage and provide the users with exact results and statistics.

Proposed Solution:

By designing this database project, I intend to provide my organization's management a structured set of all the information necessary to store and market the results to maximize profits. This information will help the users to place safe bets, be interested in the league and book tickets for the matches as well. Through this project, I am going to provide my organization a database to efficiently record the personal details about the players. This database is also going to have the records of all the teams in the IPL which are planning to buy people of desired skill sets. For example, if the officials want to reward a player who scored the highest number of runs in that particular season, it will be easy for them to reward that player by retrieving his number of runs scored attribute from the database. Secondly, the officials can to insert or update the details about the day, date, time and location of the matches that are going to be played by different teams. Thirdly, league officials can assign administrators to add/modify/delete records of players, teams and much more. Lastly, this data will be available to the idetails of the matches that are going to be played by their favorite teams. The fans can also purchase merchandise based on the performance of their favorite team or player. For example, if Virat Kohli (Player) scores the most number of runs in 2018 for his club, the sales of his jersey for his particular team for that particular year will be higher than the previous year where he was not the top run getter.

So, illustrating the main functions of proposed system:

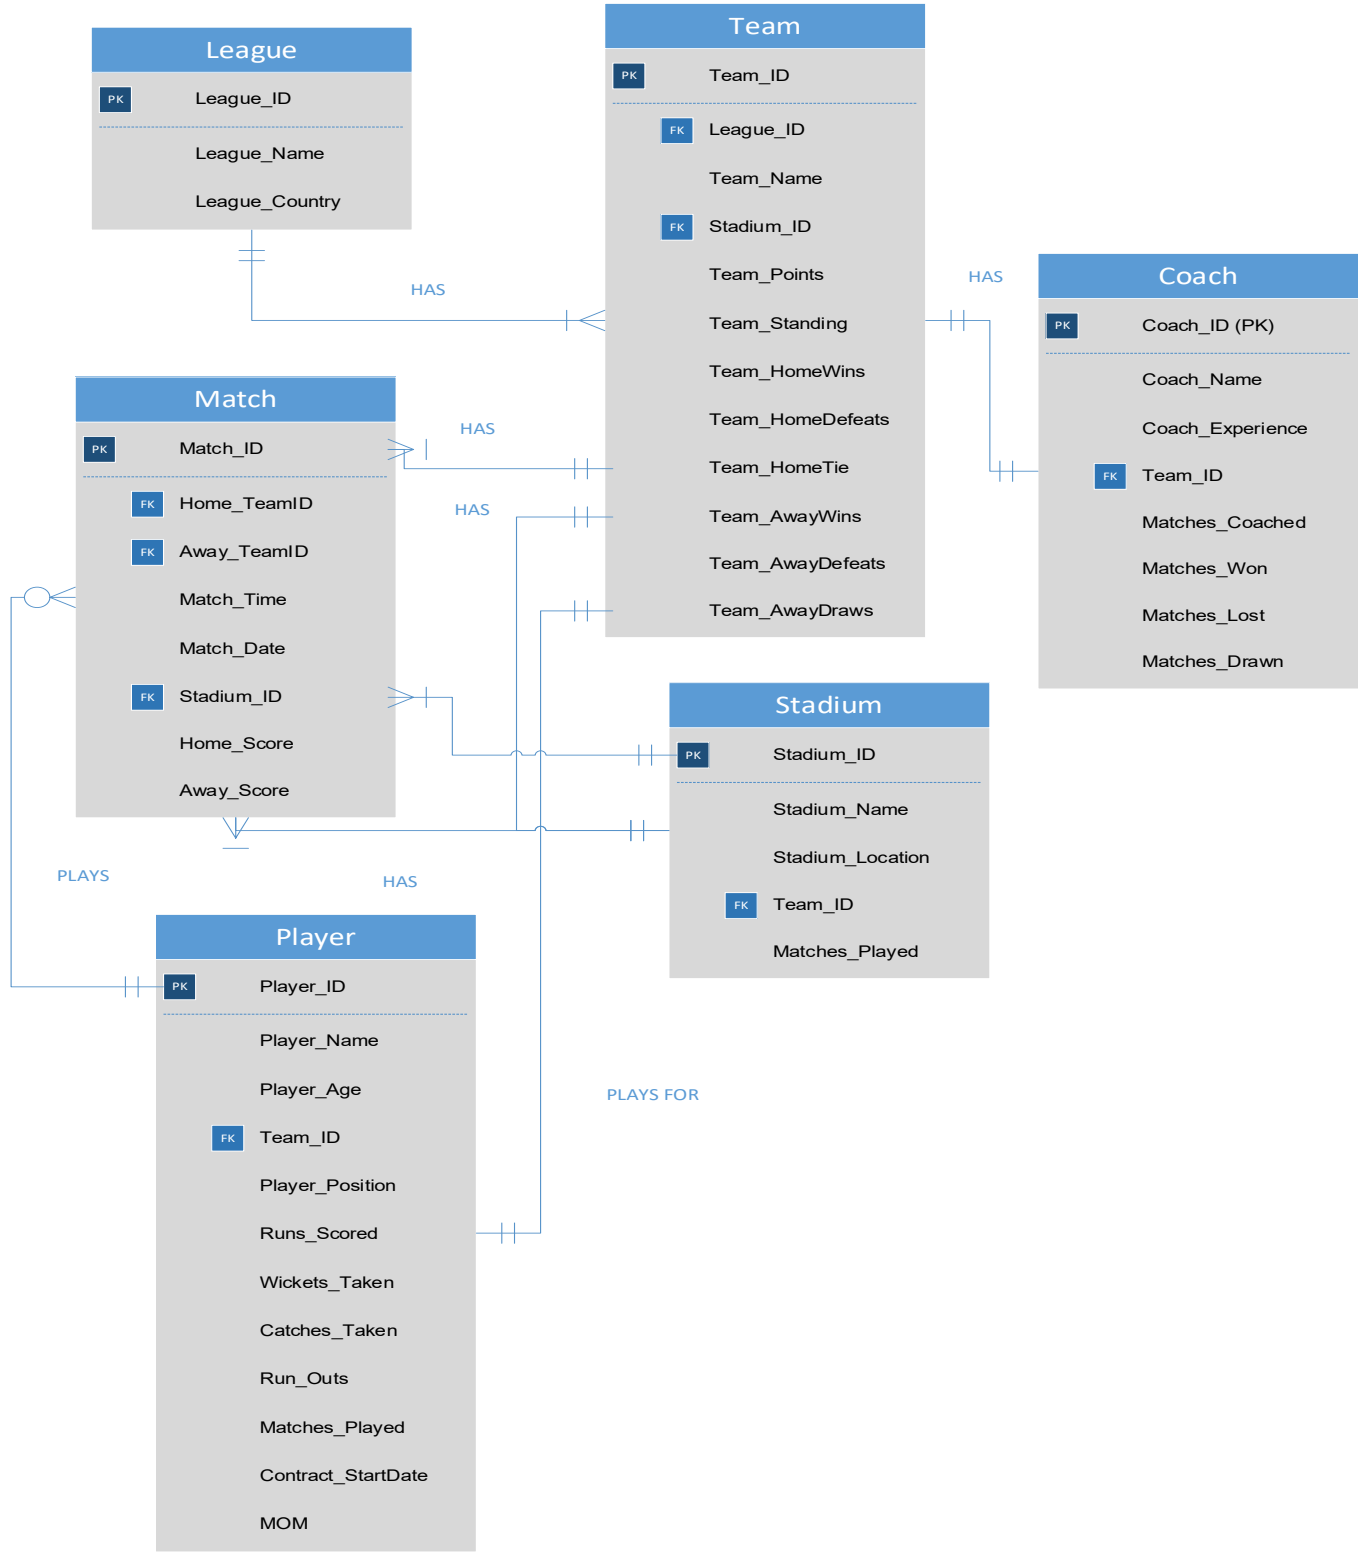

- Acquire and store the information about teams who are looking for buying players of desired skill.
- Acquire and store the information about players who are looking to play in IPL.
- Acquire the details of matches, stadium and officials.
- A database that records different statistics of players and team

Entities and Attributes Table:

Data object	Explanation
League	It stores information about the league.
League_ID (PK)	Unique ID to identify the kind of league
League_Name	It states the name of the league
League_Country	It describes the country in which the league is being played
Team	It stores information about the team
Team_ID (PK)	It should be unique
League_ID (FK)	It's a foreign key which describes about which team belongs to which league.
Team_Name	It holds the name of the team
Stadium_ID (FK)	It's a foreign key which holds information about which stadium belongs to which team
Team_Points	Number of points the team has earned in the tournament
Team_Standing	Rank of the team in the tournament
Team_HomeWins	Number of home wins of the team
Team_HomeDefeats	Number of home loses of the team
Team_HomeTie	Number of home ties of the team
Team_AwayWins	Number of away wins of the team
Team_AwayDefeats	Number of away loses of the team
Team_AwayDraws	Number of away ties of the team
Player	It holds information about the players
Player_ID (PK)	It should be unique
Player_Name	It stores the name of the player
Player_Age	It stores the age of the player
Team_ID (FK)	It's a foreign key which holds information about which player belongs to which team
Player_Position	It stores the position of player in the team(eg: captain, bowler, batsman)
Runs_Scored	Number of runs scored by a player
Wickets_Taken	Number of wickets taken by a player
Catches_Taken	Number of catches taken by a player
Run_Outs	Number of run outs by a player
Matches_Played	Number of games played y a team
Contract_StartDate	Contract start date of a player
MOM	Number of awards
Coach	It holds information about the player
Coach_ID (PK)	It should be unique
Coach_Name	It holds the name of the coach
Coach_Experience	It holds number of years of coaching
Team_ID (FK)	It's a foreign key which holds information about the team the coach is coaching
Matches_Coached	Number of games coached
Matches_Won	Number of games won under his coaching
Matches_Lost	Number of games lost under his coaching
Matches_Drawn	Number of games drawn under his coaching
Stadium	It holds information about the stadium
Stadium_ID (PK)	It must be unique
Stadium_Name	It holds the name of the stadium
Stadium_Location	It holds the location of the stadium

Team_ID (FK)	It's a foreign key which holds the information of the home stadium of a team
Matches_Played	Number of games played at the stadium
Match	It holds information about a particular match
Match_ID (PK)	It must be unique
Home_TeamID (FK)	It's a foreign key and holds the information about the home team playing the match
Away_TeamID (FK)	It's a foreign key and it holds the information about the away team playing the match
Match_Date	It hold the date at which the match was played
Match_Time	It holds the timing of the match played
Stadium_ID(FK)	It's a foreign key and holds information about the stadium at which it's played
Home_Score	It holds information about the home score
Away_Score	It holds information about the away score

Entity Relationship Diagram:

BUSINESS RULES:

- A TEAM can only be a part of one and only one league.
- A player can only play for one and only one TEAM
- A TEAM must have one and only one COACH
- A COACH can only COACH one TEAM
- A TEAM must have one and only one STADIUM.
- A STADIUM must belong to one and only one TEAM.
- A match is played between 2 teams only.
- A match must be played on one and only one stadium.
- A match must have 22 players.
- A player can only play 1 match on a particular day, date and time.

Database Infrastructure:

The database infrastructure is based on client-server model. SQL server is used as the database engine and access is used as the interface design tool. Data is inserted, deleted, updated and queried from the SQL server database with the help of forms on Access. Useful data stored on SQL database can also be viewed with the help of reports generated through access.

SQL SCRIPTS FOR CREATING AND INSERTING SAMPLE DATA:

Major Data Questions:

■ Who can Input the data

- The league officials
- Administrative staff

■ Who can query the data

- The League officials
- Administrative staff
- Team owners
- Fans

Why a fan queries the database:

To find match fixtures between different teams, what day, date and time the matches are held.

To view which players play for which club.?

To view who is the most valuable player

To view the team with most points

To view the young players from a particular team with good number of runs

Why the league officials query the database:

To set which players are playing which matches (on what day, date and time the match is between which teams and on which stadium the match is held and played by which player)

To reward the most valuable player

To reward the player from a particular team with most wins

To view the team with most points

Data Questions:

Teams with most number of wins in each league with their points.

Which team has won most number of matches?

Which player has won most number of matches?(n)

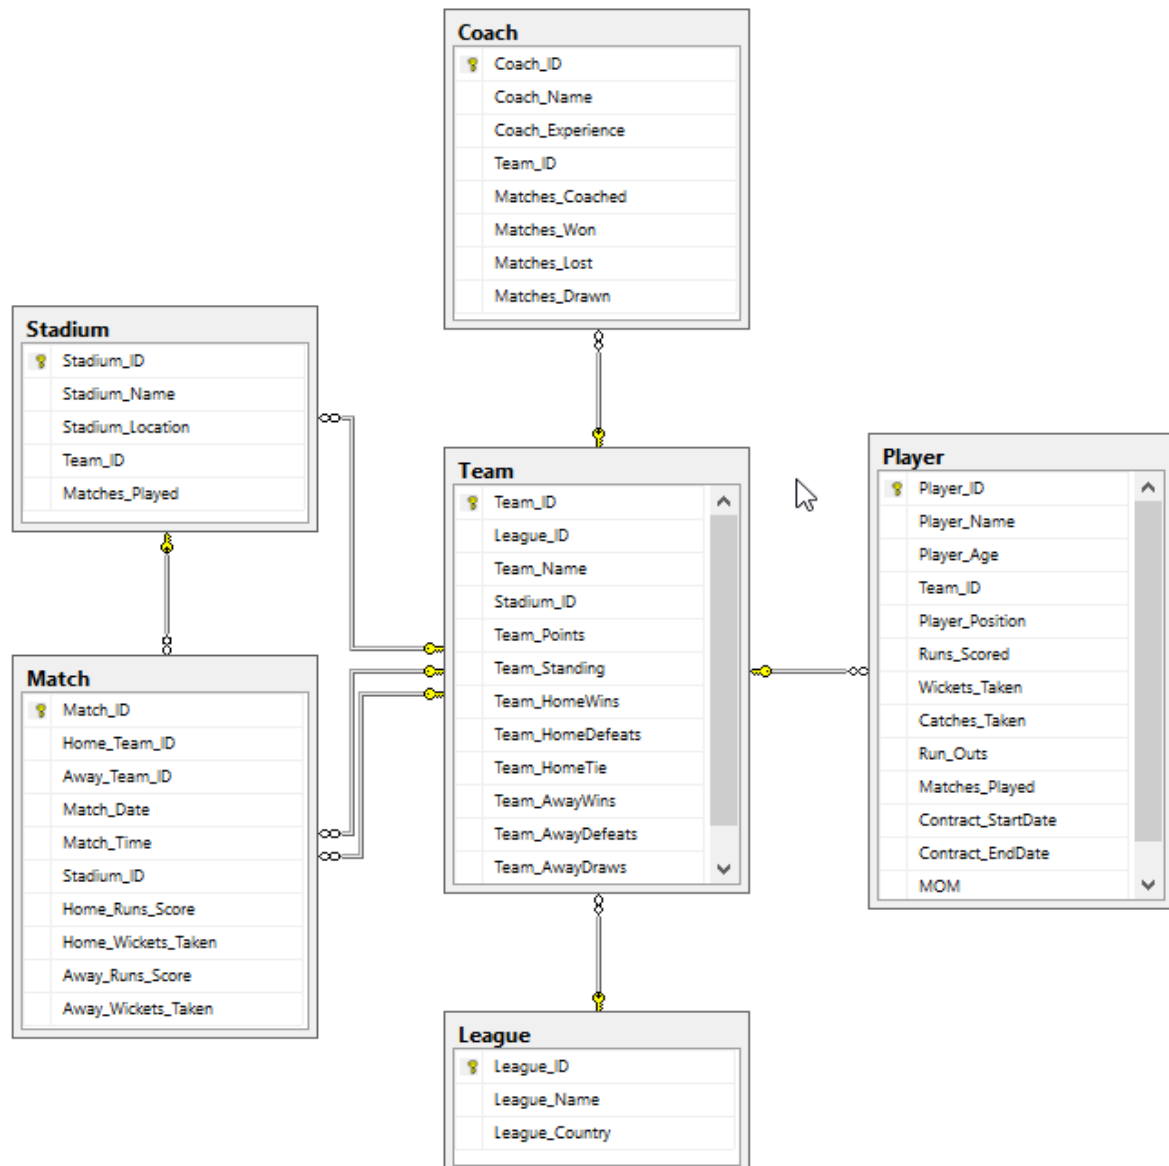

Which player has scored most number of runs in minimum number of matches ?

Which player has taken most number of wickets in minimum number of matches?

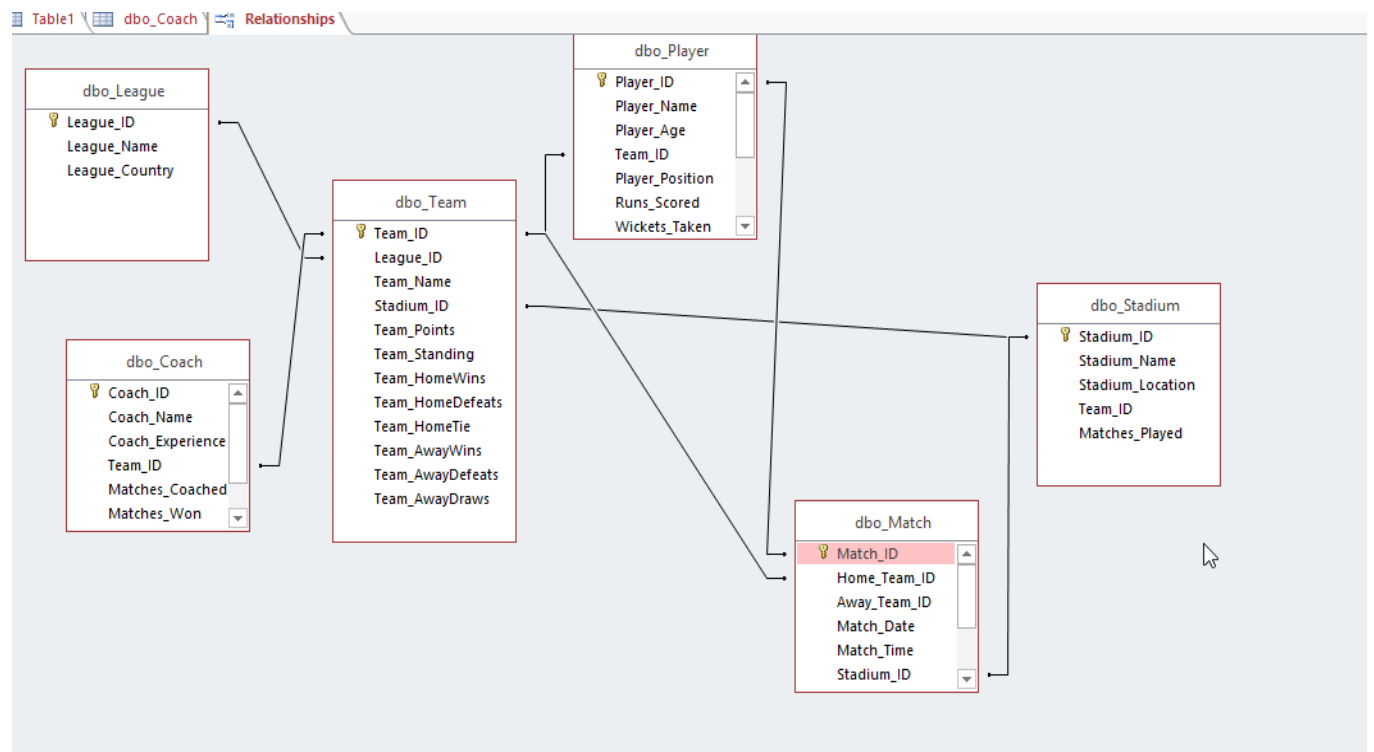

Which player has taken most number of catches in minimum number of matches?
